ABSTRACT OF THE DISCLOSURE

A motor vehicle includes a roof having at least one part which can be moved as a whole between an opened position and a closed position and which, in the closed position, extends between an area near a wind shield frame and a rear rigid roof part. The rear rigid roof part includes two lateral tips which, when the roof is closed, are overlapped on their upper side by frame parts which can be moved upward to create an opening for the passage of the movable roof part. The roof has a rear window which is mounted relatively far towards the front so that the rear window is not moved upwardly when the frame parts are moved upwardly.
